Innovation Challenge

Agile Orchestrators

AI agents for Agile ways of working

Adam Alansary · Cedric Baron · Jasper Krebbers · Theun van Vliet · Stefan Wachmann

Rabobank

Why we started

The challenge

01 02 03

Chores take time

Writing stories, refinement and status updates come back every sprint.

Scattered context

No single source of truth, so stakeholders get conflicting answers.

AI tools work blind

They don't know our backlog, code, documentation or agreements.

Our question

How can AI agents improve quality and reduce friction in our Agile workflow?

What we built

We ran a sprint at Tulip Bank, a fictional bank that works the way Rabobank does. Our AI agent could reach the board, wiki, chat, meeting notes and Miro.

13 **Skills: work instructions for the agent, kept in the repository**

Prepare

Business goal to planned sprint

`create-epic` `create-features` `create-pbis` `refinement-session` `sprint-planning`

Build

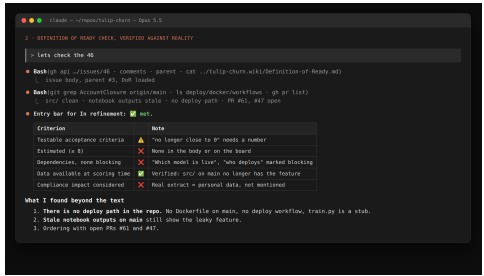

Code, pull requests, findings and docs

`work-on-pbi` `verify-publish-pr` `review-pr` `log-finding` `post-merge-docs`

Close

Wrap-up, sprint review and retro

`ending-the-sprint` `create-sprint-overview` `create-retrospective`

In refinement, the agent checks the PBI against the code and finds hidden blockers.

What we learned and what we ask

Tulip Bank works the way Rabobank does, so these lessons carry over directly.

What we learned

01 Do a task once with the agent. If it comes back every sprint, make it a Skill.

02 Give the agent all relevant context, and let it keep that context up to date.

03 Keep people in control at all times with interactive sessions. The agent proposes, a person decides.

What we ask

- Let teams connect their tools to AI agents
- Give people room to try new integrations
- Offer approved integrations in a marketplace
- Start a shared Skill library for all teams
- Allow the same connectors for every AI agent
